Impact of Long Term Storage on Dried Blood Spot Assays

National Social Life, Health and Aging Project (NSHAP)

Kristen Wroblewski, **Phil Schumm**, Hannah You, Joscelyn Hoffmann, Alan Potter, Elizabeth Kerschner, Louise Hawkley, Elbert Huang and Martha McClintock

April 12, 2023

Supported by the National Institute on Aging grants R01AG060756 (Martha McClintock and Elbert Huang, Co-PIs) and R01AG043538 (Linda Waite, PI)

Overview

- NSHAP is a national, longitudinal study of older adults
- Data collection every 5 years (2005–6, 2010–11, 2015–16 and 2022–23)
- In home survey with broad range of bio-sampling (including dried blood spots (DBS)) and biomeasures
- Round 3 DBS samples not assayed at time of collection (funds diverted to support planned recruitment of new cohort)
- Round 3 samples assayed 5–6 years later

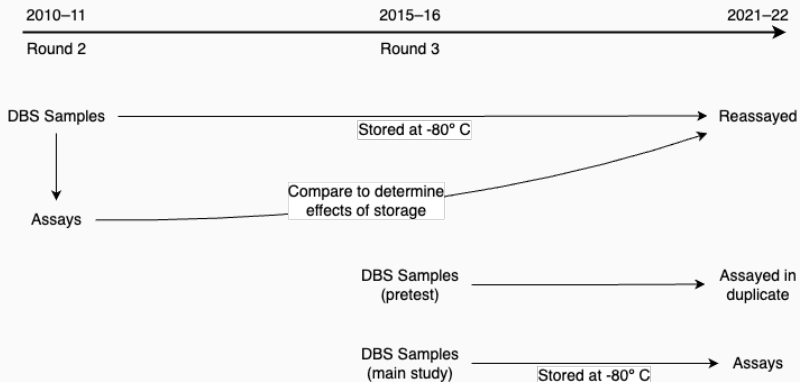

This work is relevant to:

- Decisions about when to assay samples
- Secondary use of stored samples

DBS Reassay Experiment

DBS Reassay Experiment

Statistical Model

Let y_{ij} be the log-transformed whole blood/plasma equivalent value of assay performed on sample from i th respondent at time j ($j = 1, 2$).

$$y_{ij} = \theta_i + \delta_i I_{[j=2]} + \epsilon_{ij}$$

where

$$I_{[j=2]} = \begin{cases} 1, & \text{if } j = 2 \\ 0, & \text{otherwise} \end{cases}$$

and

$$\theta_i \sim \mathcal{N}(\mu_1, \sigma_1^2)$$

$$\delta_i \sim \mathcal{N}(\mu_2, \sigma_2^2)$$

$$\rho = \text{corr}(\theta_i, \delta_i)$$

$$\epsilon_{ij} \sim \mathcal{N}(0, \sigma_3^2)$$

θ_i is the true value of the analyte in the sample, δ_j is the change due to freeze/thaw and 10 years of storage, and ϵ_{ij} is variation across spots.

Results: A1C

Results: CRP

Results: THB

Results: EBV

Model Estimates (SEs in parentheses)

<i>Parameter</i>	Log A1C (%)	Log CRP (mg/L)	THB (g/dL)	Log EBV (U/ml)
σ_1^2	0.170 (0.008)	1.198 (0.057)	1.90 (0.10)	0.708 (0.033)
μ_2	0.023 (0.006)	0.281 (0.024)	-0.18 (0.12)	-0.317 (0.050)
σ_2^2	0.072 (0.005)	0.277 (0.020)	1.25 (0.12)	0.647 (0.037)
ρ	-0.58 (0.06)	0.19 (0.09)	-0.58 (0.06)	-0.19 (0.09)
σ_3^2	0.017 (0.001)	0.093 (0.009)	0.66 (0.06)	0.067 (0.006)

Conclusions

- Storage of DBS samples *does* matter, and effect varies across analytes
- Effects may vary depending on initial level of analyte
- Additional variability due to storage was least for CRP and A1C
- If you're planning to store samples, consider incorporating experiment to assess storage effects
- Adjusted Round 3 DBS values (based on model) will be added to public dataset
